TITLE:

An investigation of the compressibility of carbon dioxide at high temperatures

PERICUICIA: Teploenergetika, no.2, 1963, 92-93

Data on specific volumes of CO2 in the temperature range of 300 to 750°C and at pressures up to 600 kg/cm2 previously published (Teploenergetika, no.5, 1962) are supplemented by new data for the following isotherms: 650, 700, 750 and 803.34°C at pressures in the range 21 to 201 kg/cm². Possible errors in the results are discussed: they may be greatest at the highest temperature because a heater failed during the tests. The pessibility of dissociation of the CO2 during the tests and its presible reaction with the steel are discussed. There is I figure.

TITLE: Chlorination in sulfur chloride medium with help of ultraviolet irradiation

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 32, no. 8, 1966, 900-901

TOPIC TAGS: chlorination, metal extracting, ultraviolet irradiation, sulfur chloride, pyrite, sphalerite, molybdenum oxide, vanadium pentoxide

ABSTRACT: A series of experiments were described in which ultraviolet irradiation was applied in low-temperature chlorination of sulfidic and exidic ores for the purpose of intensification of the process. Earlier, extraction of iron and zinc from polymetallic sulfidic ores was found to be only 65-75% complete when conventional, low-temperature chlorination in sulfur chloride medium was applied. Experimental chlorination of pyrite, sphalerite, vanadium pentoxide (V_2O_5) , and molybdenum trioxide (MoO_3) was carried out at 137C in a quartz tube irradiated by a PRK-2%1amplor without irradiation. Chemical separation of the chlorination products was described for each material. The percentage of material chlorinated with and without irradiation was: in the case of pyrite and sphalerite—78% versus 46% in 30 min; in the case of V_2O_5 —100 versus about 60% in 60 min; and in the case of MoO_3 —80 versus

about 20% in 20 min. A leveling of the yield at 80% was observed in case of MoO₃ chlorination because of substitution of sulfur for oxygen in the first stage of the process. In all cases irradiation significantly increased the chlorination rate, as shown by the respective positions of chlorination curves with and without irradiation. Orig. art. has: 2 figures.

TITLE :

National Based Metalloceramic Alloys

PERIODICAL: Tsvetnyye metally, 1960, Nr 3, pp 68-74 (USSR)

ABSTRACT 8

The branch of Powdered Metallurgy of the Central Iron and Steel Scientific Research Institute produces titanium based alloys in the form of sintered semis up to 80 kg which are worked into rods, sheets, strip, plates and wire. At present, equipment is being introduced for pressing semis up to 250 kg in weight. The experimental material on the influence of various alloying elements on titanium (IMP-lA) accumulated in the Institute is briefly described. The influence of aluminium, vanadium, iron, manganese, tin and niobium on the mechanical properties of IMP-1A alloy (strength at +20 and + 400°C; reduction in arc (neck) at +20 and -60°C) is shown in the plot, Fig 1. Of the titanium alloys for the production of sheets the most systematic investigation was carried out for the ternary system Ti-Al-V. The alloy IMP-7 (Ti + 3% Al + 2% V) is

Card 1/3

Titanium Based Metalloceramic Alloys

being produced; the properties of this alloy are given in Table 1. The manufacture of an alloy of Ti + 4% Al + 2% V (IMP-9), is proposed for the production of sheets for operating at elevated temperatures (400 to 500°C; properties given in Table 2). Alloys for the production of hot rolled tubes, forging and stamping (IMP-6/1 and IMP-6/2 composition as given Table 4), after hot working by pressure, possess the structure of metastable β phase with a small amount of α phase. This makes it possible to limit thermal treatment only to annealing of forged and hot rolled metal. The dependence of hardness of the above alloys on annealing temperature (200 to 600°C) is shown in Fig 3. The heat resistant alloy T.4 is a six component metalloceramic alloy (composition not given) and was developed for forging and stamping. dependence of its mechanical properties on temperature is plotted in Fig 4. Titanium alloys possessing the best strength and plasticity for the production of parts by sintering (with minimum subsequent machining) were

Titanium Based Metalloceramic Alloys

non den not, en poes a gress gressen en presentat en conservation en la conservation en la conservation en la c

found to belong to binary systems of Ti-V and Ti-Mo and ternary alloys of the above systems with aluminium. Their compositions and mechanical properties are given in Table 5. Properties of γ phase of heat resistant alloys of the Ti-Al system are briefly discussed. Data on the hardness of this type of alloy and its susceptibility to oxidation are given in Table 6, and Fig 5 respectively. Alloying of the alloy Ti + 33% Al with 2% nickel improves its working properties. A high resistance of this type of alloy to oxidation, a low decrease in strength with increasing temperature, low specific gravity (about 3.5 g/cm³) and the possibility of improving their technological properties by alloying, makes them suitable for the development of heat resistant alloys. There are 5 figures, 6 tables and 4 references, 3 of which are Soviet and 1 English.

TITLE: Treatment of steel fittings for the bonding of rubber to metal with adhesives in the manufacture of rubber stuffing boxes

SOURCE: Kauchuk i rezina, no. 7, 1964, 48-49

TOPIC TAGS: rubber stuffing box, rubber to metal banding, adhesive, FEN-1, metal surface treatment, degreasing, parkerizing, coating, vulcanization, bonding strength, adhesion strength

ABSTRACT: The Moscow Industrial Rubber Products Plant has mechanized the treatment of steel fittings for the bonding of rubber to metal with adhesives in the manufacture of rubber stuffing boxes. The metal surface is treated as follows: 1) twofold degreasing with agitation (bubbling of hot air) for 2-3 min at 85-90C; 2) careful' washing with hot (50-60C) running water; 3) parkerizing for 5-7 min at 60-70C with a solution of 1 part zinc monophosphate (96 g-1) and sodium nitrate (128 g-1) in 3 parts of water; 4) washing with cold and then hot (50-60C) running water; 5) drying in hot air at

ACCESSION NR: AP4042341 90-100C; 6) coating with FEN-1 adhesive by single dipping in a 10-12% adhesive solution; 7) drying for 25 min at 85-90C, and then for 20—24 hr at room temperature. The stuffing boxes are made on a nitrile (SKN-26) rubber base. The rubber in the assembled boxes is vulcanized for 6 min under a steam pressure of 7 atm. The rubber-tometal bonding strength in the finished products is $40-50~{\rm kg/cm^2}$ (GOST 209-41), and the strength of adhesion (stripping test) is ASSOCIATION: Moskovskiy zavod rezino-tekhnicheskikh izdeliy No. 1 (Moscow Industrial Rubber Products Plant No. 1) SUBMITTED: 00 ATD PRESS: 3065 ENCL: SUB CODE: MT, MM NO REF SOV: 001 OTHER: 000 Card 2/2

CITED SOURCE: Tr. Sibirsk, tekhnol, in-ta, sb. 36, 1963, 45-49

TOPIC TAGS: nitric acid production, nitric acid concentration, calcium nitrate, azeotropic mixture

TRANSLATION: The authors studied the concentration of HNO₃ in the vapors above mixtures of HNO₃ + H₂O + Ca(NO₃)₂ and found that concentrated HNO₃ is obtained in the presence of Ca(NO₃)₂. Diagrams for determining the concentration of HNO₃ in the vapors and the boiling point of mixtures of HNO₃ + H₂O + Ca(NO₃)₂ in relation to their composition were constructed. These showed that this system has in azeotropic point near 68.4%, so that the spent solution will contain approximately 70% Ca(NO₃)₂. Authors' summary

TITLE:

Determination of Brittle Strength of Plastics by Means of

Notched Samples

PERIODICAL: Zavodskaya laboratoriya, 1960, Vol. 26, No. 11,

pp. 1293 - 1297

TEXT: The author describes experiments of testing brittle strength of metals by means of notched samples. Armco iron, 10, 20, 45, y8 (U8), 別T (YalT) steels, and N68 (L68) brass were studied. The following was measured: change of the profile during the application of stress change of the microstructure by determining the axial elongation $\boldsymbol{\epsilon}_{e}$ and the

radial contraction $\epsilon_{_{_{\mathbf{T}}}}$ of the grains. The following results were obtained:

When stress is applied to the samples consisting of plastic material (armco iron, 10, 20, YalT steel, L68 brass) the material at the bottom of the notch is subject to strong deformation. Hence, according to the theory of small plastic deformation, the problem cannot be solved by

Card 1/2

Determination of Brittle Strength of Plastics S/032/60/026/011/023/035 by Means of Notched Samples B004/B067

analytical methods. For steels containing less than 0.35% carbon, brittle strength cannot be determined by means of notched samples. For C>0.35% to 0.65% brittle strength may be calculated according to G. V. Uzhik (Ref. 4) and for C>0.65% it may be determined directly. For plastic carbon steels (C<0.35%) alloyed austenite steels and nonferrous metals brittle strength cannot be determined since at maximum stress the entire cross section is subject to plastic deformation. These investigations were made under the supervision of Academician N. N. Davidenkov. There are 6 figures and 4 references: 1 Soviet, 2 US, and 1 German

TITLE. On the Application of a Capacitive Strain Gage for the Recording of Mechanical Vibrations (O primenenii yemkostnogo datchika pri

zapisi mekhanicheskikh kolebaniy)

PERIODICAL: V sb.: Vopr. poroshkovoy metallurgii i prochnosti materialov. Nr 3. Kiyev, AN UkrSSR, 1956, pp 117-121

ABSTRACT: The paper suggests the use of the simplest type of capacitive strain gage for the recording of mechanical vibrations. The author shows analytically the absence of distortion in the law governing the damping of an impulse of the type

 $u_{m} e^{-\alpha} t_{sin\,\omega t}$

when passing through an amplifier with a limited pass band. The paper adduces the circuit of an amplifier used for the recording, with the aid of a capacitive strain gage, of longitudinal vibrations with frequencies of the order of 1.5 kc and with 5-250 μ amplitudes.

Mel'nichuk, P.I. (deceased) and Timoshenko, V.G. Equipment for the determination of modulus of

AUTHORS: elasticity at low temperatures TITLE:

PERIODICAL: Izmeritel'naya tekhnika, no.4, 1962, 11-12 The article describes equipment made in the Institut metallokeramiki i spetsial'nykh splavov AN USSR (Institute of determination of modulus of elasticity in the temperature range uctermination of modulus of elasticity in the temperature ra +20 to -195 °C. It is based on measurement of frequency of longitudinal vibrations in a rod made of the tested material. It is shown that the accuracy depends mainly on the accuracy of measurement of resonance frequency which in this equipment is 0.2%, so that the error of determination of the modulus of elasticity is not greater than 0.5%. The vibrations are generated by a capacitative transducer driven by signal generator and the resonance frequency is determined from Lissagou's figures on an oscilloscope screen using an auxiliary signal

Card 1/2

Equipment for the determination ... 5/115/62/000/004/002/007 E194/E154

generator. The resonance indicator is a four-stage low frequency amplifier with valve voltmeter. The sample chamber is described. It can be cooled with liquid nitrogen and is jacketed by an evacuated space to provide thermal insulation. Liquid nitrogen can be kept in the chamber for about an hour and the rate of temperature rise is in the range -4 to -195 °C at a rate of 0.6°/min. In determining the modulus of elasticity allowance is made for changes in specimen length and density. There are 3 figures.

Strength of Sintered Materials (Cont.)

SOV/6342

PURPOSE: The book is intended for engineers, scientific research workers, aspirants, and students concerned with problems of the strength of sintered materials and structural parts.

COVERAGE: The book reviews the results of studying the strength, ducfility, and elasticity of materials and structural parts protion on these methods. Particular attention is given to methods of experimental investigation of physical and mechanical charactristics of heat-resistant sintered materials with specific properlines, and to the description of a number of testing units dethe strength of brittle sintered materials and high-porosity ductile materials are discussed. Laws governing changes in charactristics of strength and elasticity under the effect of various with data on the basic mechanical characteristics of a number of lurgy Institute V. I. Kovpak, Yu. A. Kashtalyan, L. V. Kravchuk. Chebotarev is acknowledged. There are 141 references, mostly Soviet.

AUTHOR:

Tymoshenko, V.H. (Kiev)

TITLE:

Calculation of the flexural oscillations of a beam

in the case of hysteresis damping

PERIODICAL:

Prykladna mekhanika, v. 9, no. 1, 1963, 33-41

TEXT: There are two basic forms of internal damping of energy in the oscillations of mechanical systems, considered from an engineering standpoint: a) the dissipation of energy in the material of the elastic elements of the system, and b) the damping due to slip-through between the parts of the system. For both types of damping, under cyclic loading-relieving conditions, a hysteresis loop is obtained, in the first case for the stress-strain relationship and in the second case for the load-displacement curve. The problem of energy damping in the flexural oscillations of a beam is considered, using the results of the author's previous work (Prykladna mekhanika, v. 8, no. 5, 1962), certain functions and parameters having complex values in this case. The distribution of amplitudes

Card 1/2

Calculation of the flexural ...

S/198/63/009/001/002/006 ... D251/D308

is obtained in terms of complex Krylov functions, and equations are established for the normalized impedances in the flow section. The following cases are considered in detail: a) the resonance regime of a supported beam which produces a moment of the support, the drive and torque being calculated, and b) a cantilever with damping in the fixture, the equivalent dissipation coefficient being considered and its dependence on the rigidity being demonstrated. There are 3 figures.

Strength of Sintered Materials (Cont.)

SOV/6342

PURPOSE: The book is intended for engineers, scientific research workers, aspirants, and students concerned with problems of the strength of sintered materials and structural parts.

COVERAGE: The book reviews the results of studying the strength, ducfility, and elasticity of materials and structural parts produced by powder-metallurgy methods and presents brief information on these methods. Particular attention is given to methods of experimental investigation of physical and mechanical characteristics of heat-resistant sintered materials with specific properties, and to the description of a number of testing units developed for these investigations. Some problems of the theory of the strength of brittle sintered materials and high-porosity ductile materials are discussed. Laws governing changes in characteristics of strength and elasticity under the effect of various factors are outlined. The appendix includes reference tables with data on the basic mechanical characteristics of a number of sintered materials. The assistance of members of the Powder Metallurgy Institute V. I. Kovpak, Yu. A. Kashtalyan, L. V. Kravchuk. A. P. Yakovlev, V. K. Kharchenko, V. K. Kuz'menko, and V. A. Chebotarev is acknowledged. There are 141 references, mostly Soviet. Card 2/9 3/2

Vyp. 20. M., 1964, 187-191

TOPIC TAGS: coagulation, particle amountments, conductor

acoustic field

ABSTRACT: The paper deals with the calculation of the coefficient for determining the coagulation rate (changes in the concentration of particles per unit of time). It is assumed that forces arise around the particle in the acoustic field at a certain distance from the particle (from the coagulation surface) which lead to instantaneous coagulation. The coagulation process is considered stationary. The determination of the coagulation probability under these assumptions becomes an electrostatic problem: the determination of field near the surface of a charged conductor. L. Zarembo. TITLE: The fundamental characteristics of a model learning automaton and certain results of its learning to discriminate patterns $\mu_{e}\nu$

SOURCE: AN SSSR. Nauchnyy sovet po kompleksnoy probleme Kibernetika. Bionika (Bionics). Moscow, Izd-vo Nauka, 1965, 45-51

TOPIC TAGS: logic circuit, logic element, pattern recognition, algorithm, electronic feedback, automaton

ABSTRACT: Logic circuits made up of threshold elements are used as the basis for a learning automaton. These bases were proposed by Varshavskiy in 1962. The problem of pattern recognition is solved by finding the logic function which divides the sets of independent binary variables into two classes. Where Varshavskiy used an ideal logic circuit of threshold elements, in the present work the weight factors of the input of every threshold element in the first layer do not change during teaching and can accept only one of three fixed values +1,0,-1. With respect to this, the inputs of a threshold element divide into activating (ξ =+1), retarding (ξ =-1) and blank (ξ =0). The thresholds of all the elements are the same and remain constant

throughout the entire process. Every threshold element realizes the function

 $y_i = \text{sign} \left[\sum_{i=1}^n \xi_i x_i - \eta \right]$, where ξ_i is the weight factor of the i-th input; x_i is the value of the input

binary input variable at the i-th input; η is the threshold value; n is the number of the inputs of the automaton and $j = 1, 2, 3, \ldots$ n. The specific advantages of this automaton are the large volume of information about the signal, the parallel processing principle, and the use of distributed memory. It should be added that there are individual memory units for storing weight factors for each threshold element. The automaton was used in 1962 for discriminating the letters of the Russian alphabet, numbers, and various geometric figures. The methodology for teaching the automaton is discussed. Algorithms were used in the majority of cases. Feedback was discontinued and every element was checked for its correct answer to the teaching sequence. The teaching process was continued for those elements which gave wrong answers. Curves are given showing the increase in the number of correct answers for the elements of the automaton. A part of the experiment consisted of finding out whether the automat was able to recognize new elements of the images already incorporated. This phase of the experiment was called "checking the automaton for generalization." Under these conditions 60 to 80% of the answers were correct. The automaton was simulated on high speed digital computers when the linear law of weight factor change was verified. It is shown that the automaton becomes more flexible with an increase in the number of elements or the complexity of structure. Orig. art. has: 6 figures, 4 formulas.

Record of Work on Labor Protection and Safety

Techniques in the Tatsinskaya Geological Exploratory

Party

PERIODICAL:

Razvedka i okhrana nedr, 1959, Nr 8, pp 56-58 (USSR)

ABSTRACT:

Different measures taken by the administration and members of the Tatsinskeya Geological Exploratory party of the Volgo-Donskoye territorial nove geologicheskoye upravlenive (the Volga-Don Territorial Geological Administration) concerning labor protection and safety technique are described in this article. Different safety installations, the introduction of various devices to protect the worker cut down considerably the number of casualties in the party. Every day special inspectors (I.A. Grebenyuk, I.S. Savenko, N.A. Lysenko, etc.) check the safety installations and immediately report on every infringe-

ment of the regulations or on installation defects.

SCV/132-59-8-15/18

Record of Work on Labor Protection and Safety Techniques in the Tatsinskaya Geological Exploratory Party

The party also introduced many improved tools and working methods proposed by: senior drilling master V.F. Yeremin (a special handle for the friction clutch of the ZIF 1200 m drilling rig, a special bridge for the ZIF-1200A drilling rig); the fitter of the garage A.P. Chernetskiy (a safe way to fill the batteries with sulfuric acid); senior inspector I.S. Savenko (a rational method to press the drivepipes into a bore hole with an S-80 tractor), etc. The party also took part in a competition on safety technique, sanitation, and fire-prevention measures, and was awarded first prize by the Volga-Don Geological Administration This Administration, jointly with the Upravleniye Rostovskogo okruga (Rostovskiy Okrug Administration), with the Gosgortekhnadzor of the RSFSR and the territorial committee of the trade union, introduced special certificates for all leading geological exploratory specialists stating

TITLE: Natural-oscillation Frequencies of Shallow Parabolic Arches of

Variable Cross Section (Chastoty svobodnykh kolebaniy pologikh

parabolicheskikh arok peremennogo secheniya)

PERIODICAL: Tr. Dnepropetr. in-ta inzh. zh.-d. transp., 1956, Nr 25, pp 301-

317

ABSTRACT: Frequencies are given for the natural oscillations of shallow symmet-

rical fixed parabolic arches the cross-sectional moments of inertia

of which vary according to the law

 $I_{x} = \frac{I_{1}}{1 - [(1-n)(2x/\ell)] \cos \phi}$ ($n = \frac{I_{1}}{I_{2} \cos \phi}$),

where I_1 and I_2 are the moments of inertia at the keystone and the springer, respectively, x is the distance of the cross section under

consideration from the keystone, I is the span of the arch, and ϕ is the angle of the slope of the tangent to the cross section with respect

Card 1/2

Natural-oscillation Frequencies of Shallow Parabolic Arches of Variable (cont.)

to the horizon. In setting up the differential equations of the oscillations, the displacements are determined without consideration to the effect of the curvature or the transverse forces; the longitudinal forces are considered only for the calculation of the lateral thrust. Only the vertical components of the inertia forces are included in the calculation. The solution of the oscillations equation is accomplished by means of the Bubnov-Galerkin method. The well-known basic functions of the oscillations of parabolic arches $I_x = I_1$ sec ϕ are selected to represent the P functions which fulfill the boundary conditions of the problem stated. The results of the calculations are arranged in tabular form with the values of the coefficients of the primary and the secondary frequency n ranging from 1 to 0.2, respectively, and the values of f/i (where f is the rise of the arch and i is the radius of inertia of the keystone cross section) ranging from 0 to 0.20. The error of the solution is investigated. Approximate formulas obtained from the data of alreadycompleted arch bridges are given for the primary and secondary peripheral frequencies v_1 and v_2 , respectively. Mention is made of the satisfactory accuracy $\nu_1 = 0.0773(344-1)$

 $v_1 = 0.0773(344-1)$ $v_2 = 0.12(316-1)$ $(120 \le l \le 230 \text{ m})$ $(120 \le l \le 230 \text{ m})$
